

Plumbed in water coolers

NEW EVIDENCE that replacing bottled water coolers with mains-fed systems in the workplace could reduce UK businesses carbon footprint by 68,593 tonnes per annum, representing a 70% emissions saving, is claimed by a carbon footprint analysis carried out by Premier Watercoolers, a provider of plumbed in water coolers to businesses across the UK.

Premier said that CO₂ emissions for the UK bottled market amounted to circa 98,000 tonnes compared to around 29,000 tonnes if all users of bottled water coolers converted to mains-fed systems.
